

What can we do if there are no good targets

Mathematical and Computational Biology in Drug Discovery Module II

Dr. Jitao David Zhang
March-April 2024

The linear view of drug discovery builds on target-based approaches

Target identification & assessment

Five strategies when no good target is found

1. Phenotypic drug discovery
2. Natural products
3. Biologics
4. Interaction-based (multispecific) drug discovery
5. Drug repurposing or combination studies

Connect the lines!

- Phenotypic screening
- Modified natural products
- Biologics
- Target-based screening

Phenotypic screenings by agent and readout

Agent

High-throughput screening
libraries ($\geq 10^6$ molecules)

Genetic libraries ($\sim 10^4$)

Natural products and chemo-
genomic libraries ($\sim 10^3$)

Custom libraries ($\sim 10^0 - 10^2$)

The Small-molecule Pathway Research Kit (SPARK)

Now known as the Pathway Annotated Chemical Ensemble (PACE) library

The ChEMBL database

- An example of query: [aspirin](#).
- Systematic and programmatic accession via [ChEMBL API](#) ([source code](#)).
- We can use **dose-response data** to annotate the *triplets* of compound, assay activity, and targets.

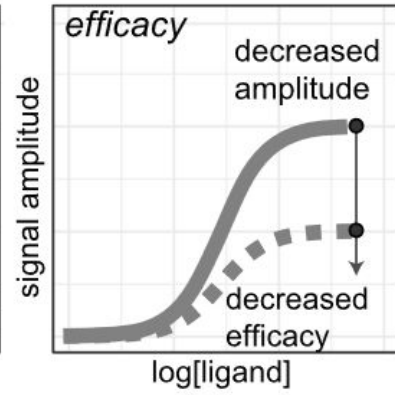

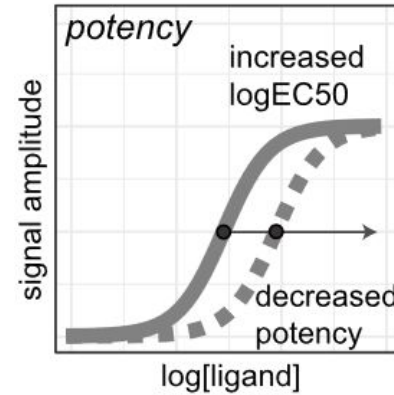

Visualization of ChEMBL
(version 33; 2024)

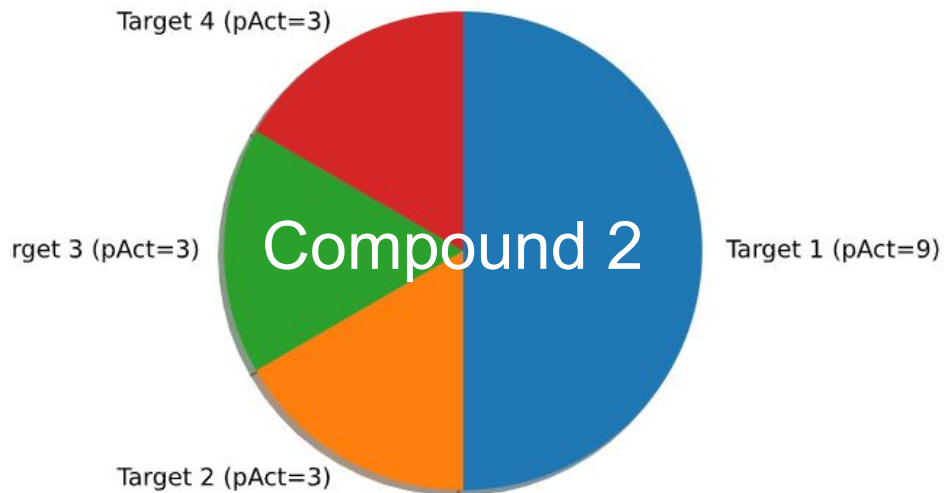

Discussion

1. Why do we care selecting *representative, potent, and selective* compounds?

2. How to define following terms mathematically ...
 - a. Representativity?
 - b. Potency?
 - c. Selectivity?

A toy example about how to quantify a compound's potency and selectivity

The Gini Index (a.k.a. Gini Coefficient)

A random vector of 50 values

Sorted from low to high

The Gini Index is calculated based on the cumulative distribution: larger value \rightarrow large inequality

$$G = A / (A + B)$$

The Gini Index quantifies inequality/ selectivity

NEUROD1

205296_at

RBL1

The Gini Index of expression of *NEUROD1* across tissues is near 1, whereas that of *RBL1* is near 0.

An alternative metric: Shannon's Entropy

Compound 1
Shannon entropy:0.00

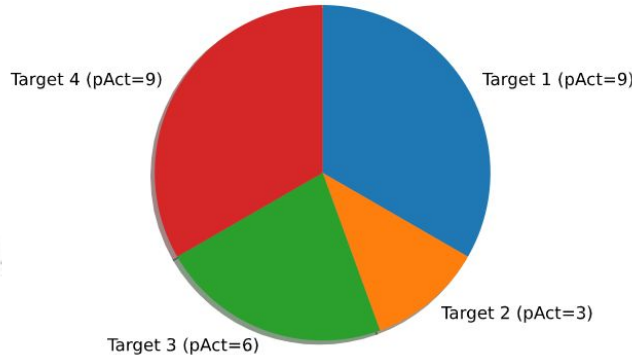

Compound 2
Shannon entropy:2.00

Compound 3
Shannon entropy:1.79

Compound 4
Shannon entropy:1.89

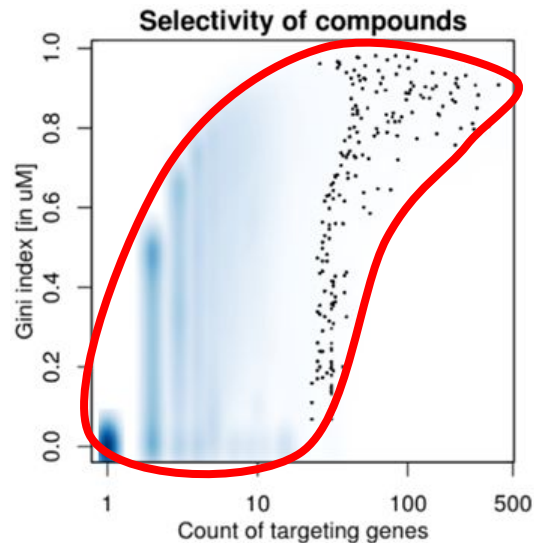

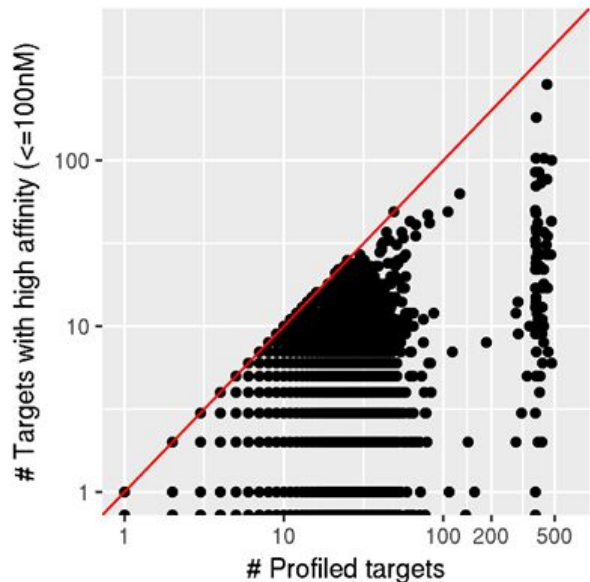

Compound 5
Shannon entropy:3.17

$$H(X) := - \sum_{x \in \mathcal{X}} p(x) \log p(x)$$

Count of targets and selectivity of ChEMBL molecules

With some exceptions, most compounds are profiled against <100 targets. We distinguish between specific and pleiotropic compounds.

The **shark-fin shape** curve suggests that frequently profiled compounds tend to be more selective (and *vice versa*).

Unsupervised clustering

Affinity Propagation updates **responsibilities** and **availabilities** iteratively

Affinity Propagation in action

Conclusions about chemogenomic library

- Phenotypic drug discovery can lead to first-in-class drugs with novel mechanisms;
- Unsupervised machine learning and data modelling contribute to build chemogenomic libraries;
- We can link drug candidates via targets to biological pathways and processes.

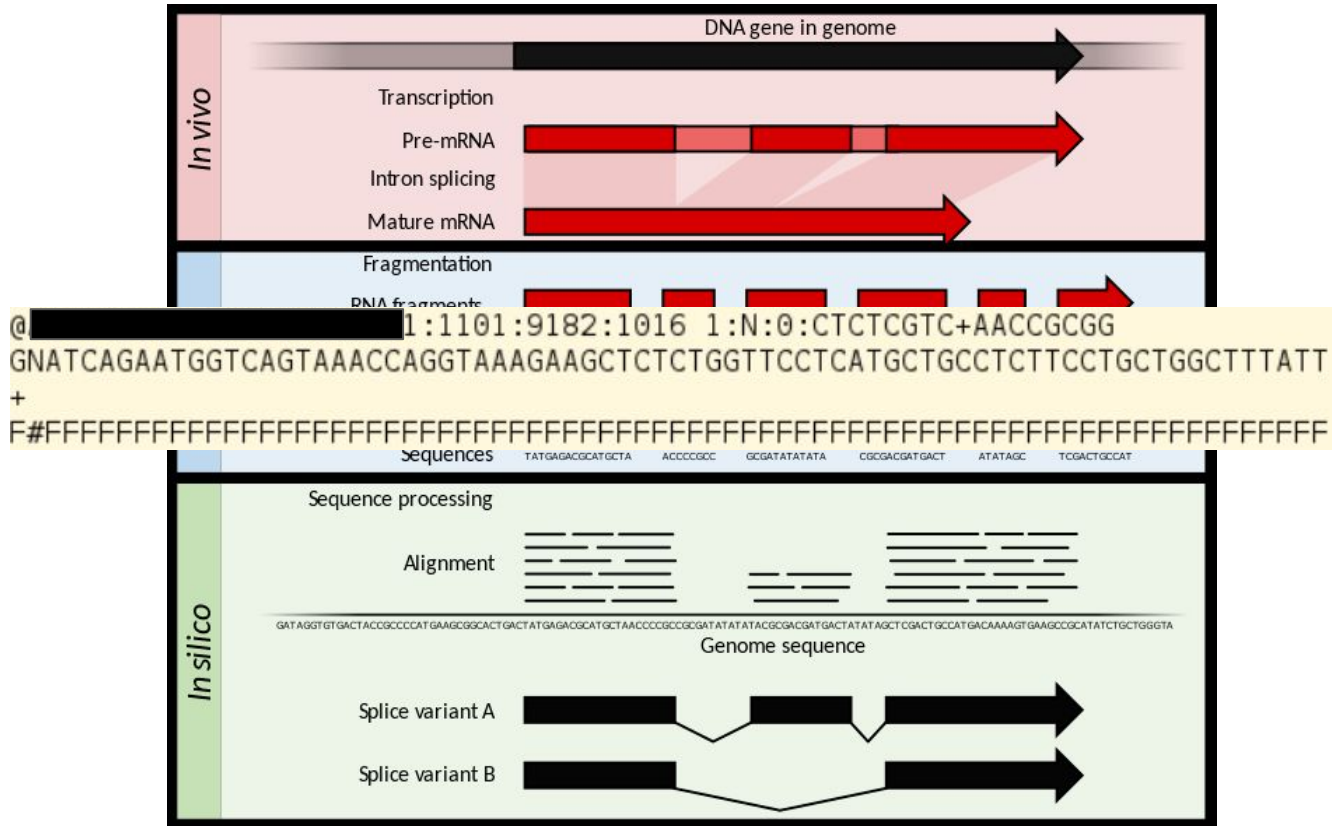

Offline activities of Module II

Please use your favourite programming language (shell scripts, python, R, for instance) and APIs (Application Programming Interfaces) of databases to perform following operations. Submit your code.

1. Retrieve all approved drugs from the ChEMBL database, sort them by approval year and name ([a Python example is here](#); documentations of the ChEMBL API can be found [here](#));
2. For each approved drug **since 2014** that you identified in step (1), retrieve a list of UniProt accession numbers, namely protein targets associated with the drug;
3. For each protein with a UniProt accession number that you identified in step (2), retrieve UniProt keywords associated with it. [You can use the UniProt API, documented here](#). [Python](#) and [R](#) clients are also available.

Transcriptome profiling by RNA sequencing

Differential gene expression results

Gene-set Enrichment Analysis Methods

Gene-set enrichment analysis

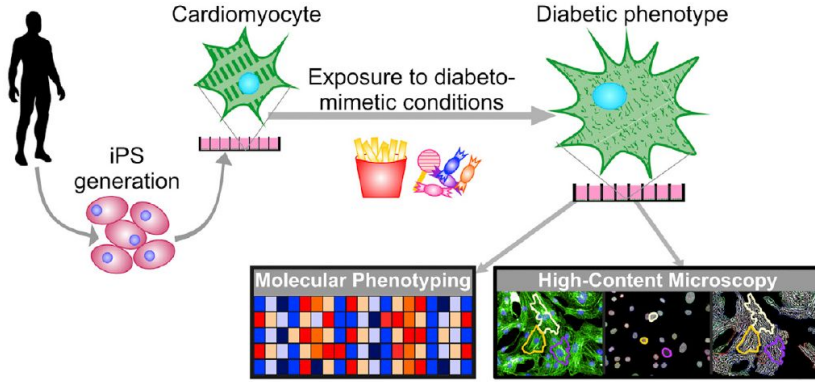

Input: (1) a differential gene expression profile; (2) a set of gene-sets $\{G\}$, each a set of genes.

Output: a ranked list of the input gene-sets by *enrichment*.

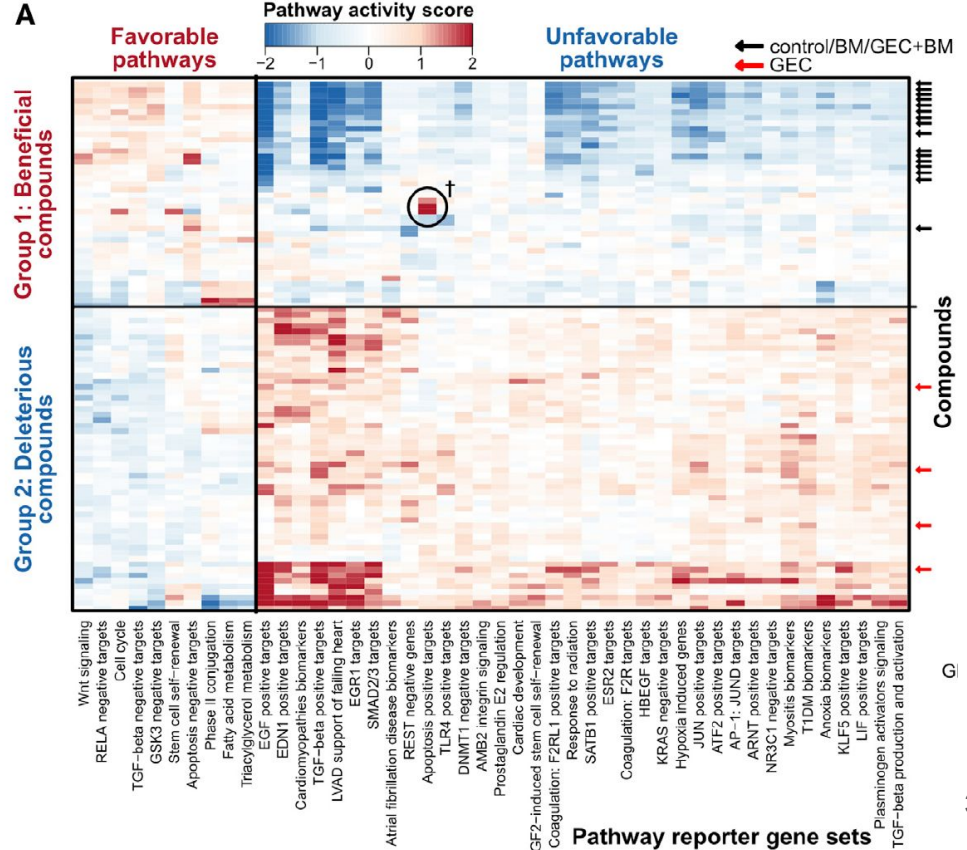

Probability theory and statistical tools discussed

- Distributions
 - Gaussian distribution (used in linear model)
 - Bernoulli distribution \rightarrow Binomial distribution \rightarrow Negative binomial distribution
 - Poisson distribution \rightarrow Negative binomial distribution
 - Poisson distribution \leftrightarrow Exponential distribution
- Statistical methods
 - Bootstrapping method
 - Student's t-test
 - Wilcoxon-Mann-Whitney test
 - Kolmogorov-Smirnov test

Gene expression as screening readout

Differential gene expression profiles are molecular snapshots of drugs' action in the cell.

Gene expression from patient and animal models help compound selection

We can prioritise molecules that reverse disease-induced changes.

Morphology as screening readout

Cytological profiling for antibiotics discovery

- P:** Protein translation inhibitors
- R:** RNA transcription inhibitors
- D:** DNA replication inhibitors
- L:** Lipid biosynthesis inhibitors
- C:** Cell-wall synthesis inhibitors (peptidoglycan)

Principal components are linear combination of morphological features

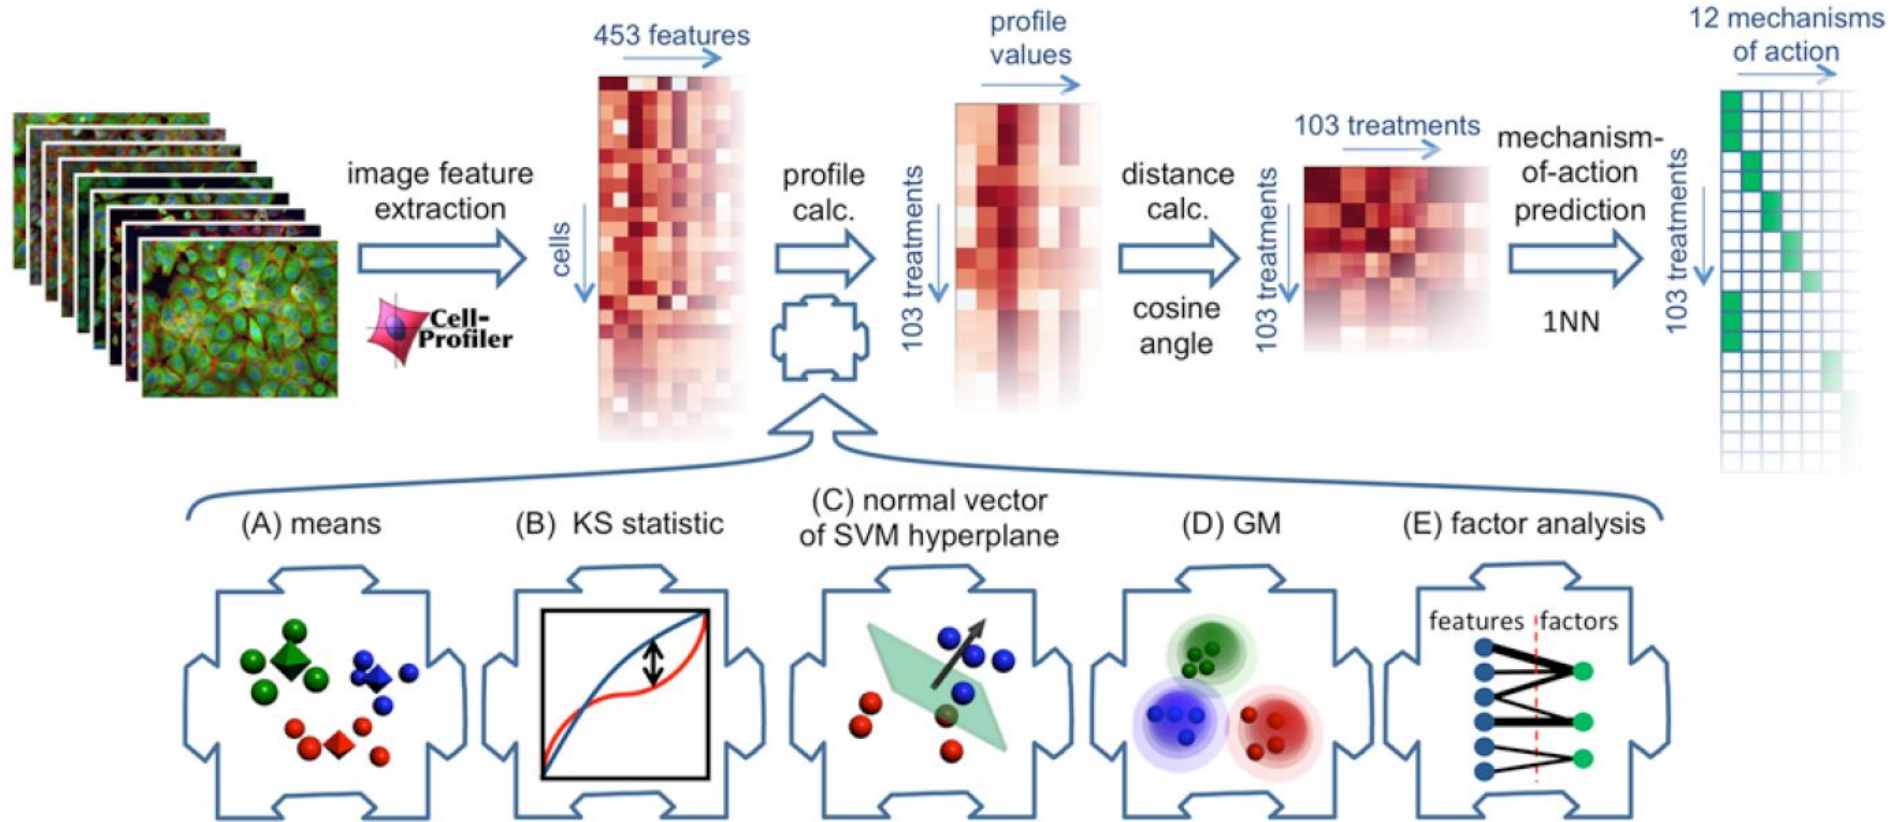

Membrane area, μm^2 DNA area, μm^2 Membrane perimeter, μm DNA perimeter, μm Membrane length, μm DNA length, μm No. of nucleoids per cell
 Membrane width, μm DNA width, μm Membrane circularity DNA circularity SytoxG intensity DAPI intensity Decondensation

Morphology classifies compounds by MoA

Comparison of computational methods

Do the benchmark and use Occam's Razor

Table I. Accuracies for classifying compound treatments into mechanisms of action.

Method	Accuracy, %
Means	83
KS statistic	83
Normal vector to support-vector machine hyperplane	81
With recursive feature elimination	64
Distribution over Gaussian mixture components	83
Factor analysis + means	94

True mechanistic class

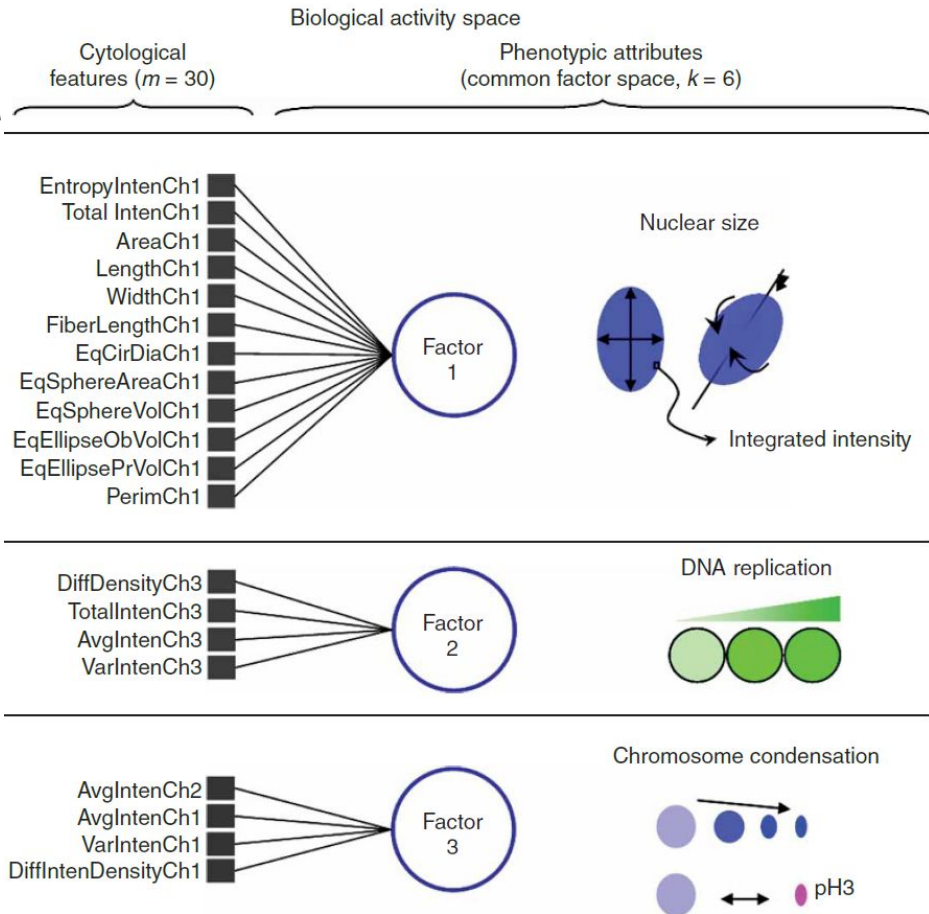

Actin disruptors	Act
Aurora kinase inhibitors	Aur
Cholesterol-lowering	Ch
DNA damage	DD
DNA replication	DR
Eg5 inhibitors	Eg5
Epithelial	Epi
Kinase inhibitors	KI
Microtubule destabilizers	MD
Microtubule stabilizers	MS
Protein degradation	PD
Protein synthesis	PS

A possible explanation for the success of latent variable models

$$\begin{matrix} \text{Cells} \\ \begin{pmatrix} x_{11} & \cdots & x_{1m} \\ \vdots & \ddots & \vdots \\ x_{n1} & \cdots & x_{nm} \end{pmatrix} \\ \text{Cytological features} \end{matrix} = X_{nm} = \underbrace{\sum_{i=1}^k L_{ni} F_{im}}_{k\text{-factor space}} + \varepsilon_{nm}$$

A multi-cell-type, 1008-compound screening by Cox *et al.* (2020)

Conclusions

- Gene expression and image-based profiling can be used individually or jointly for phenotypic screening;
- Integration of biological knowledge, high-throughput data, and statistical modelling empowers phenotypic drug discovery.
